Galaxy Note8

5 things you didn't know you could do with...SPen

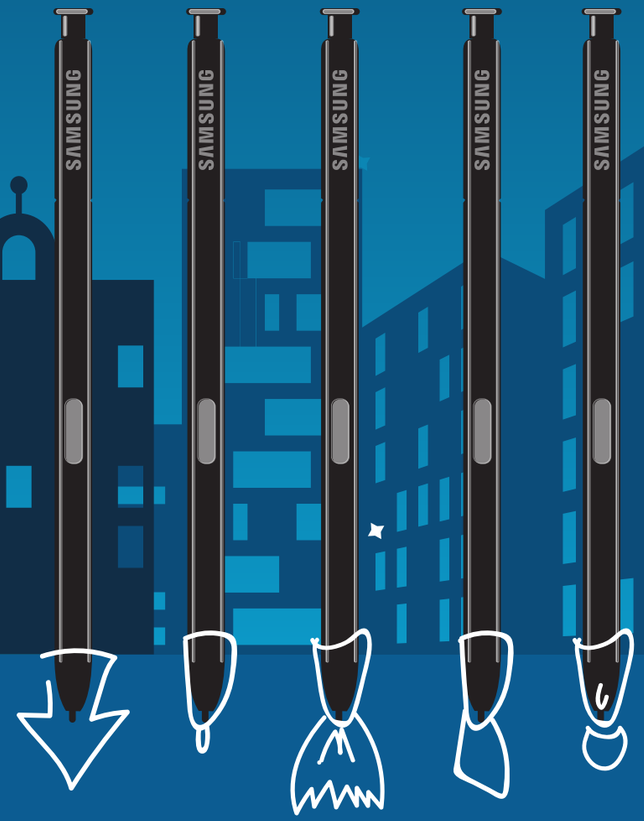

Image Recognition

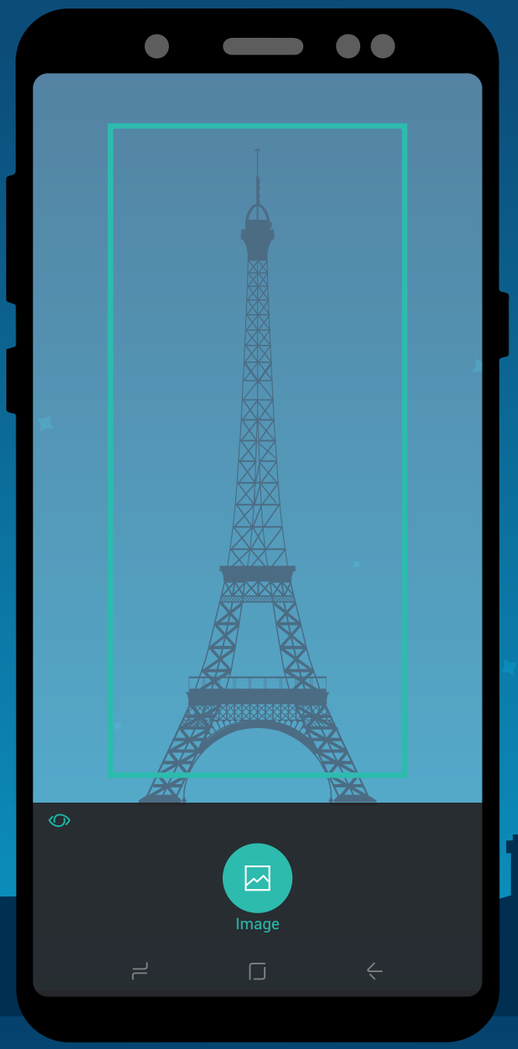
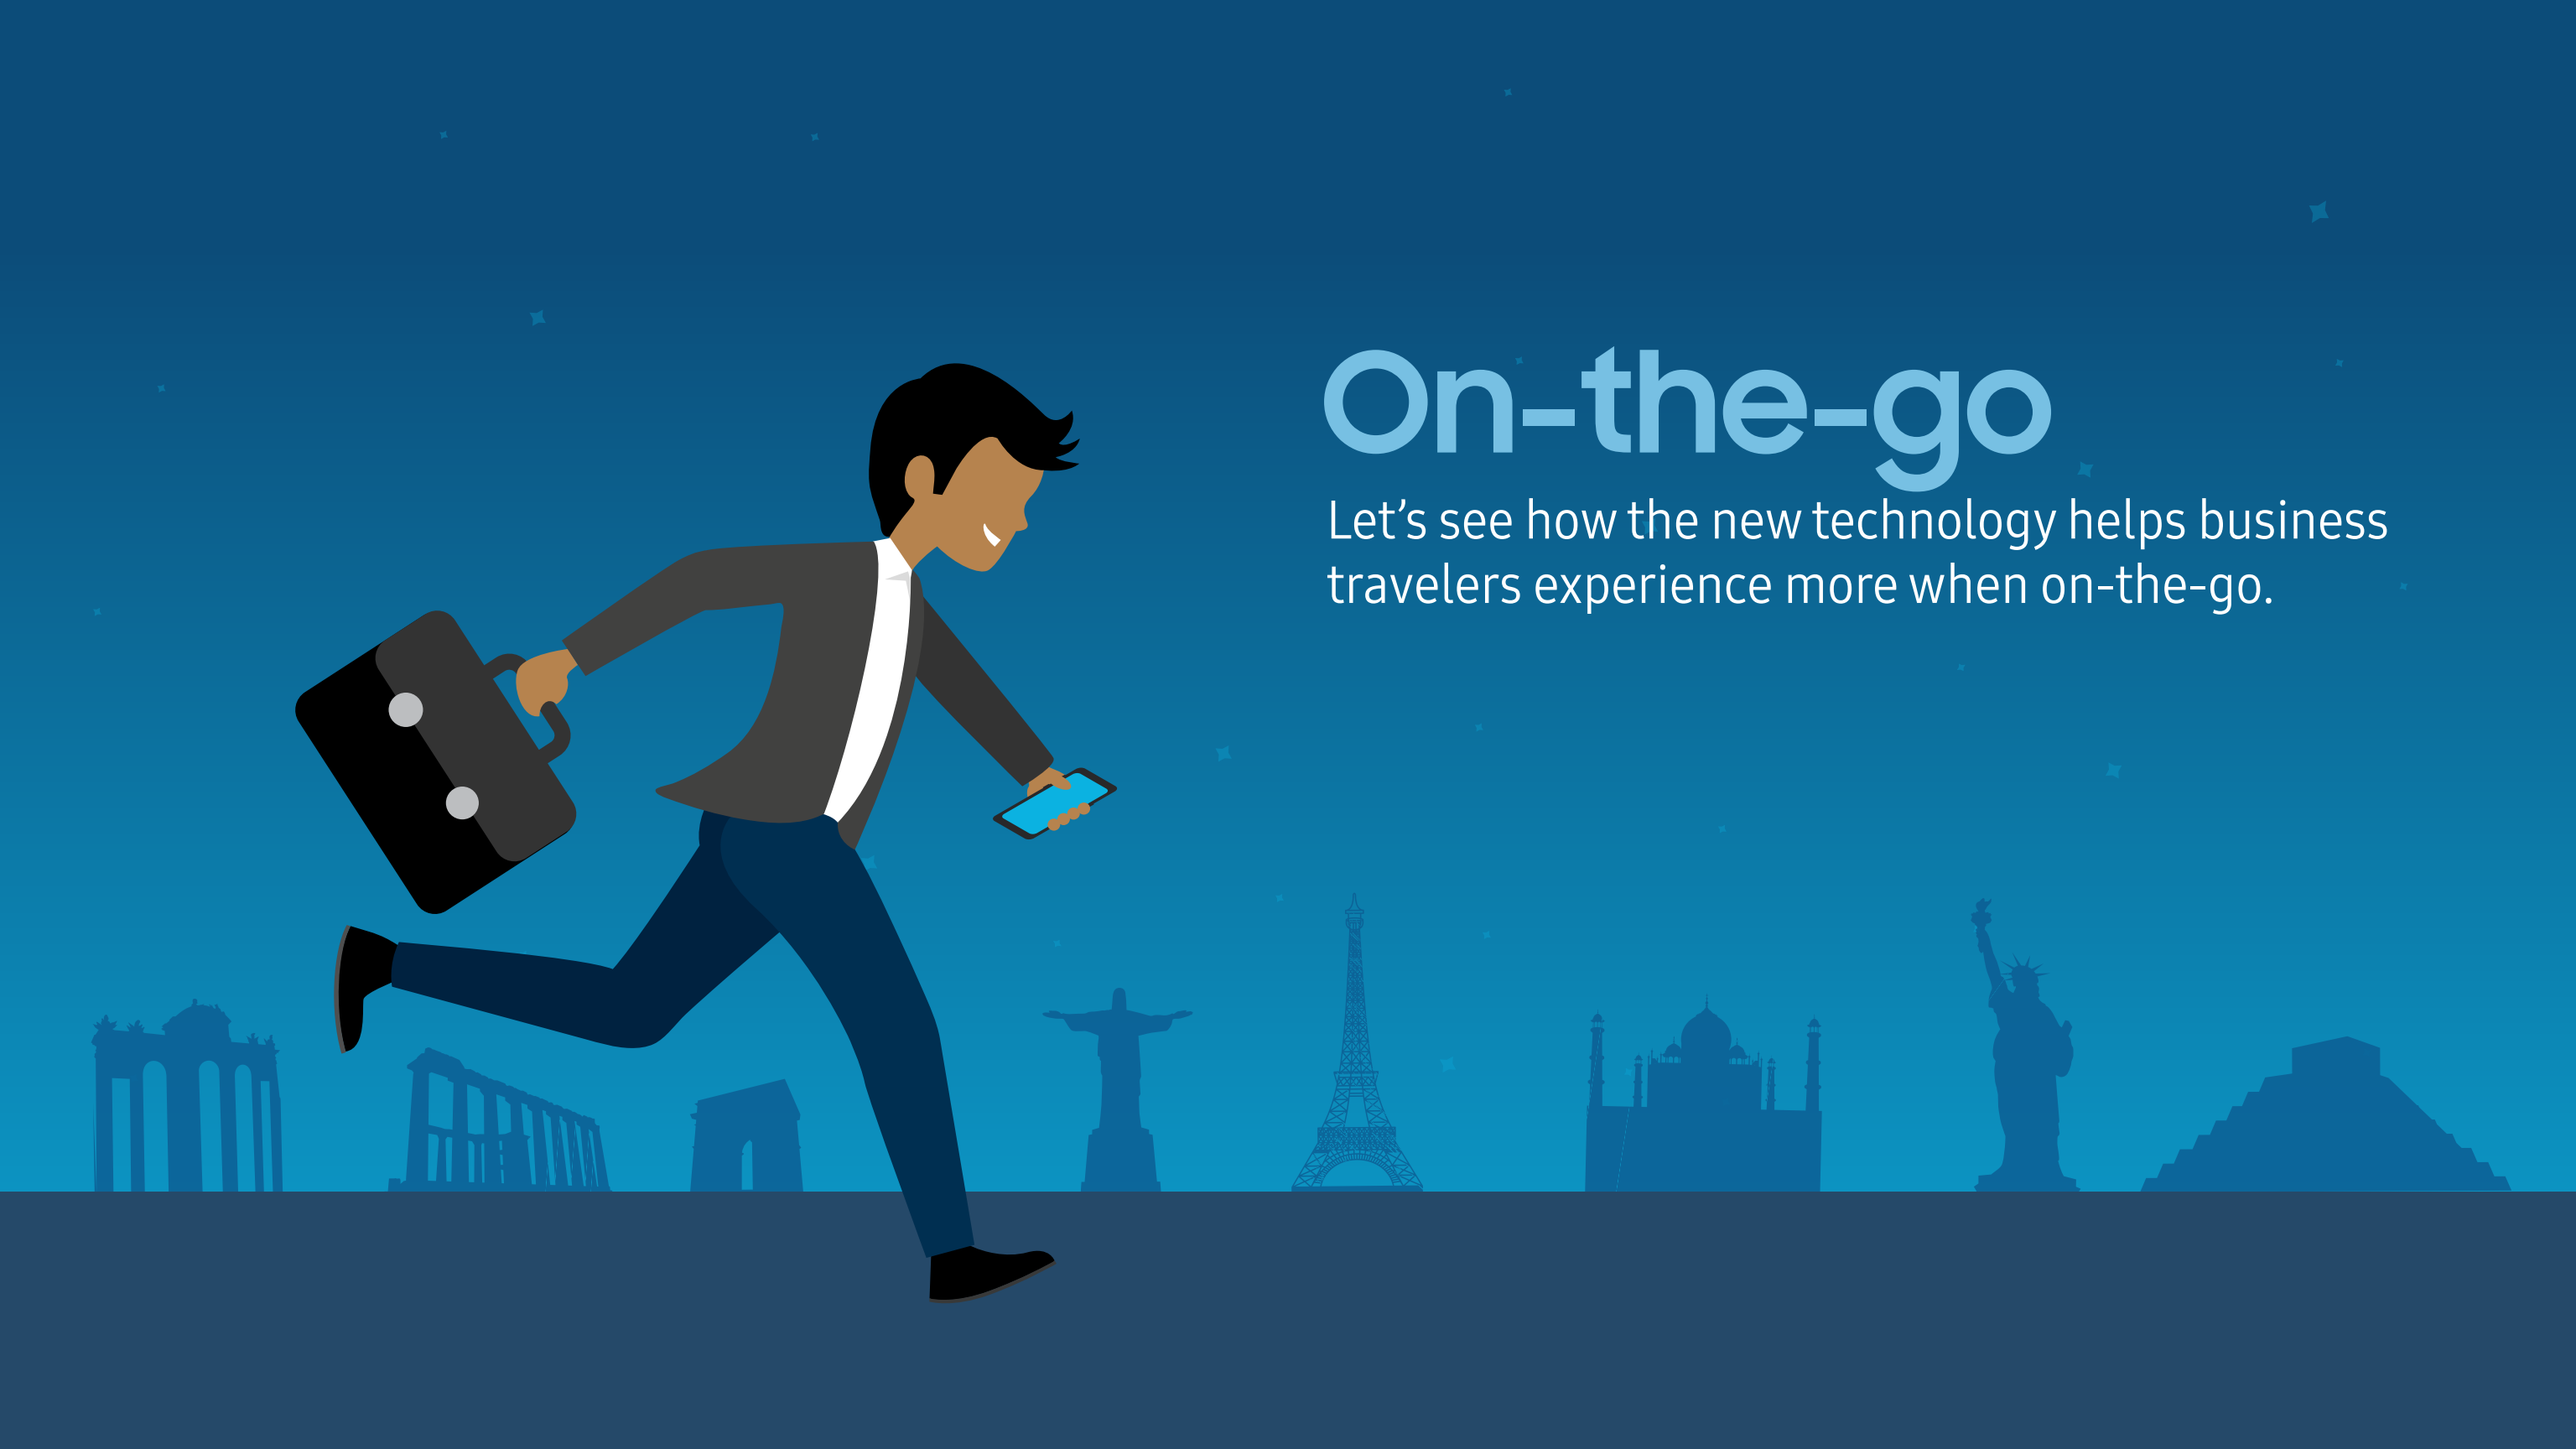
Image recognition technology brings vision intelligence to the camera.

It is used to **identify things** such as people, buildings, places, logos, and other objects of interest.



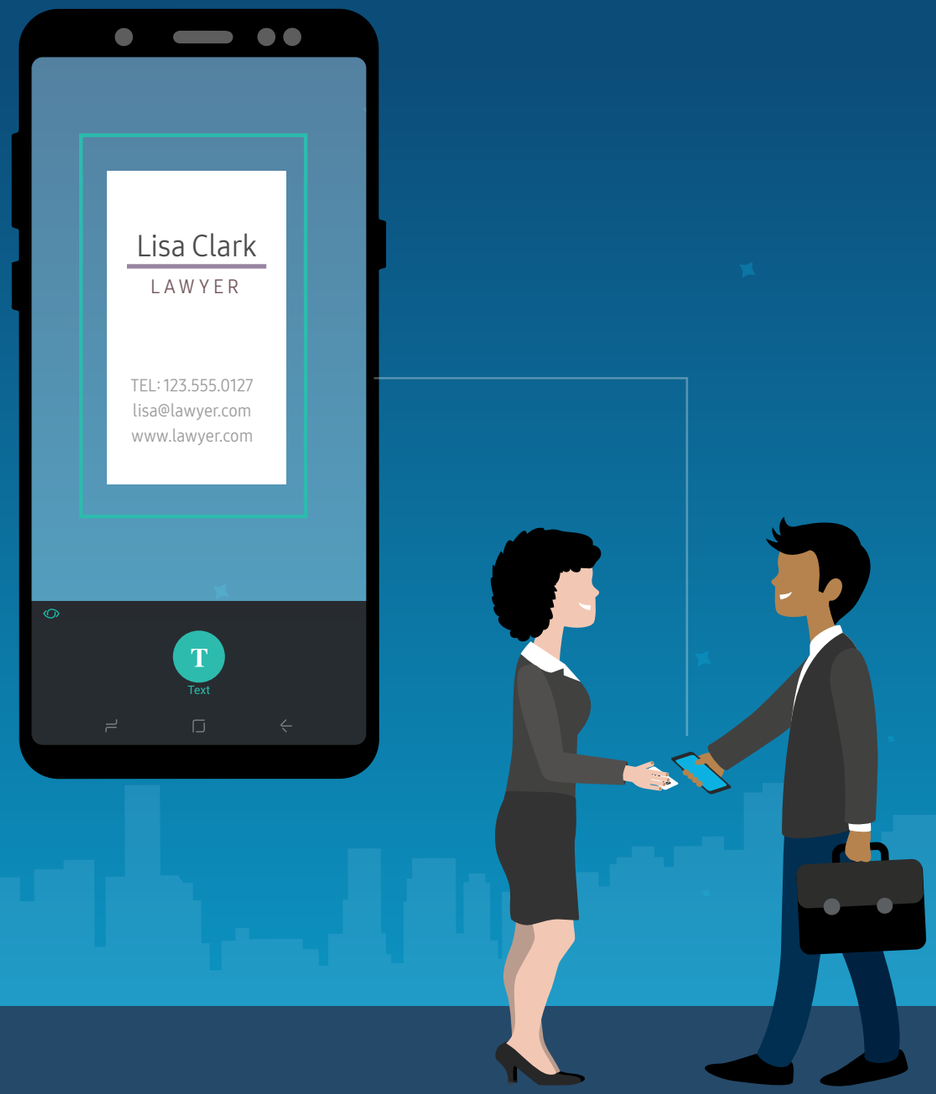


On-the-go
Let’s see how the new technology helps business travelers experience more when on-the-go.

Add contacts quickly

When business travelers meet new clients or partners, they traditionally spend time inputting new contact information into their smartphone.

With Bixby Vision, travelers can now quickly scan business cards and save contact information directly into the contact app.



Find places the new way

Finding a good restaurant was hard when business travelers relied on travel guides and hotel recommendations.

Bixby Vision finds great places to eat simply **by pointing their device at a landmark.**

Restaurant options with reviews pop up, and point travelers in the right direction.

Language barrier

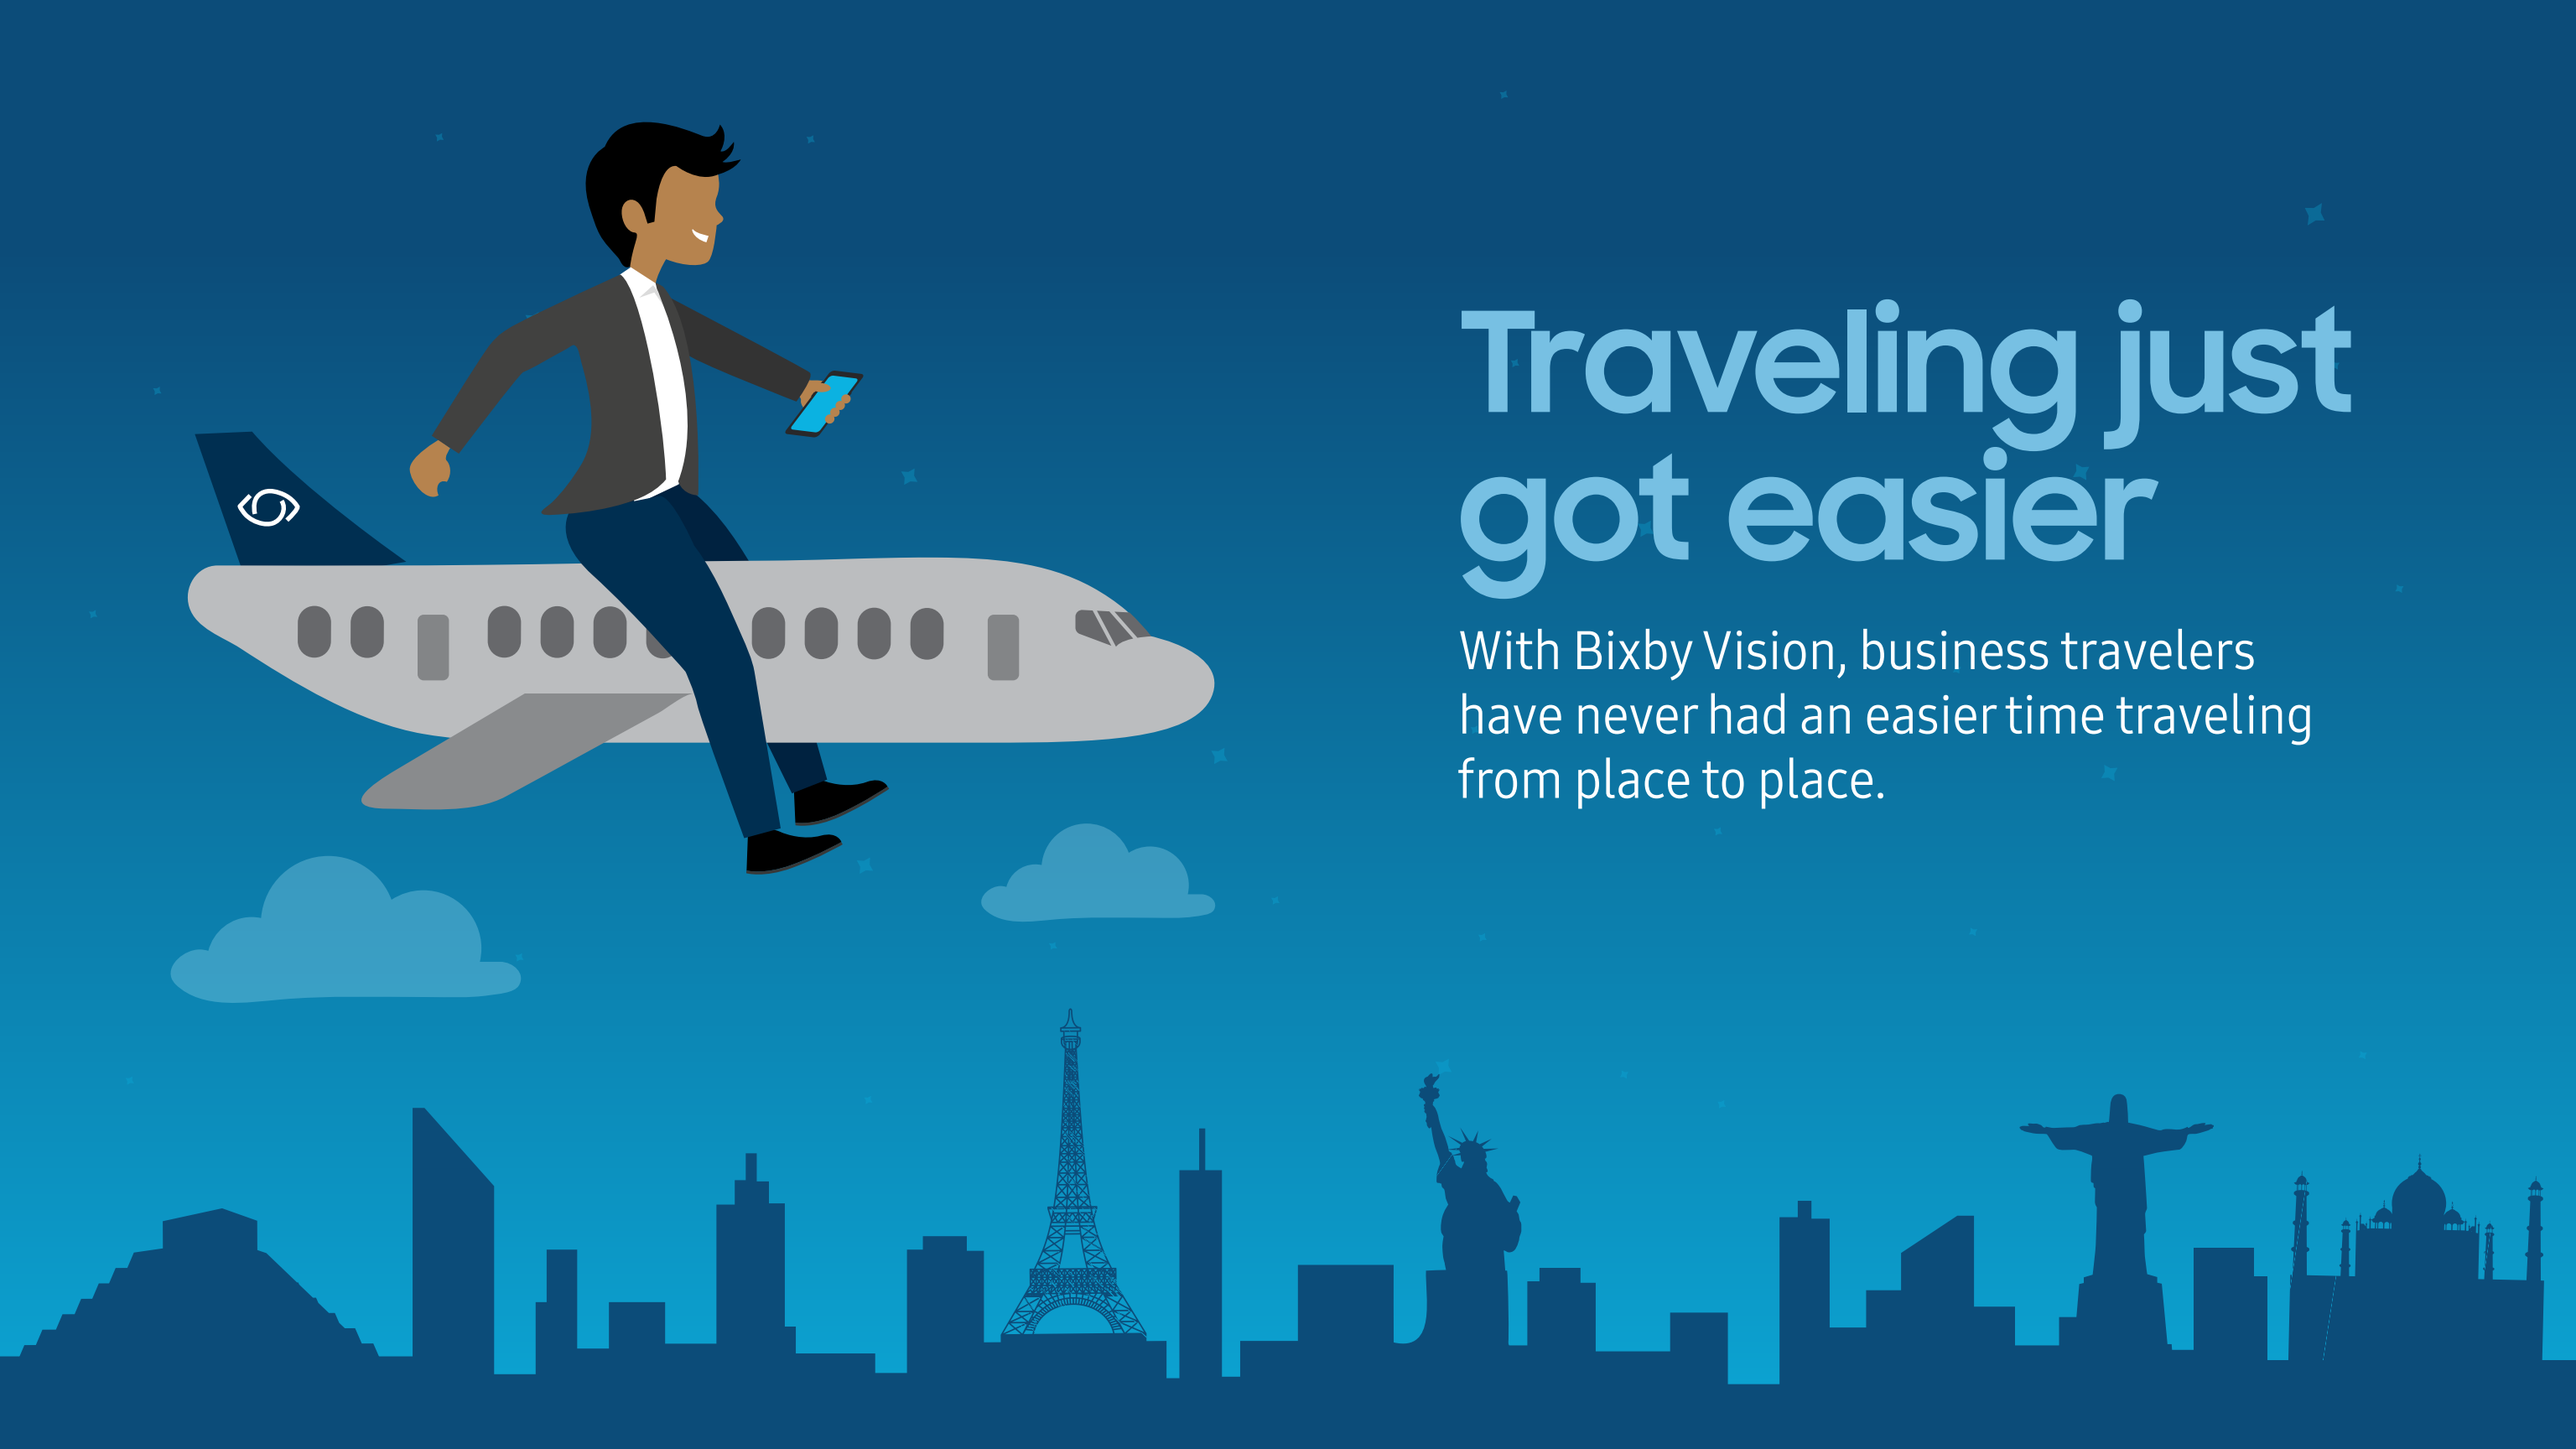
Trying to pick a dish can be difficult if travelers are not proficient in the native language.

Bixby Vision helps travelers translate words by scanning text on a page or screen.

Wine Scanning

Business travelers no longer need to memorize wine pairing lists.

Bixby’s wine scanning feature also helps to impress clients with in-depth knowledge of wine varietals and distinctive notes.



Traveling just got easier

With Bixby Vision, business travelers have never had an easier time traveling from place to place.
